

**BACK-** THE BACK OF THE TORSO SEEMS A BIT LONGER THAN THE FRONT, AND IS ABOUT 3 1/2 HEADS. THE BUTT HANGS DOWN FURTHER THAN THE GROIN.

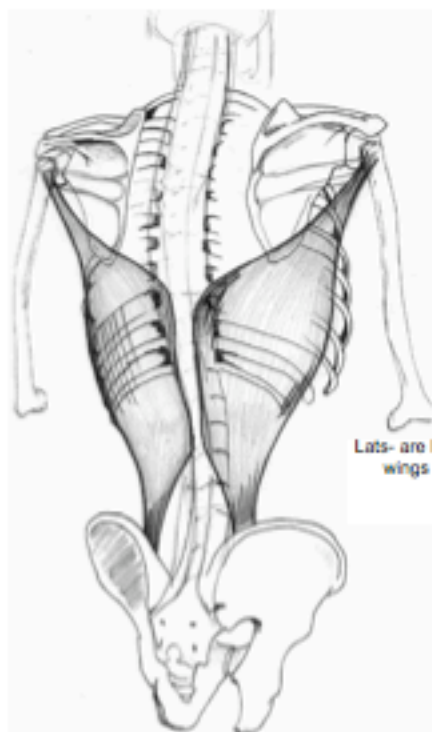

"towing" muscles attach the scapula to humerus

Erector spinae run along the spine

THE MUSCLES ON THE BACK ARE IN MULTIPLE LAYERS THAT OVERLAP EACH OTHER.

THE INNERMOST LAYER IS MADE UP OF ERECTOR SPINAE, INFRA SPINATUS, TERES MAJOR AND THE RHOMBOIDS.

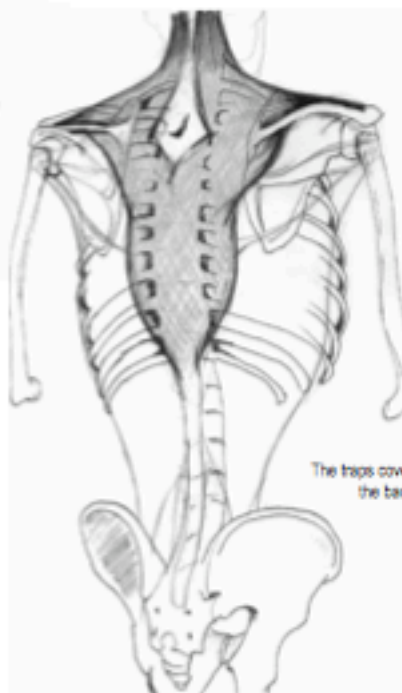

Lats- are like wings

THE NEXT LAYER WOULD BE THE LATISSIMUS DORSI. THE MIDDLE BACK STRETCHES FROM THE PELVIS UP TO THE HUMERUS.

THE OUTERMOST LAYER CONSIST OF THE TRAPEZIUS STARTING WITH THE BACK OF THE SKULL, OUT TO THE SHOULERS AND DOWN TO THE EDGE OF THE RIB CAGE.

The traps cover most of the back.
